New born babies from HBs antigen positive mothers should be received anti-HBs human immunoglobulin (HBIG) and HB vaccine. Schedule follows HBIG is intramauscularly injected to the neonates within 48 hr and 2-3 months after birth, followed by vaccination starting at the time of the second immunoglobulin injection. The vaccine is given three times; the first two at an interval of one month and the third one in three months after the first one. (apply to health insurance)
