Newborn babies from HBs antigen positive mothers should receive anti-HBs human immunoglobulin (HBIG) and HB vaccine. HBIG is intramuscularly injected to the neonates within 48 hr and 2-3 months after birth, followed by hepatitis B vaccine starting at the time of the second immunoglobulin injection. The vaccine is given three times; the first two doses at one month apart and the third one in three months after the first dose. This is covered by health insurance.

60-64 year-old persons who have severe disorders of the heart, kidney, respiratory organs, or from the human immunodeficiency virus should receive Hepatitis A vaccine.

Category I: The objective is to protect the public health. Immunization is strongly recommended by law.

Category II: The objective is to protect the individual’s health. This is available on request.
